1 Gate 2016 (cs-set 1) Q:29

Consider the experiment with the following steps.

- 1) Flip a coin twice.
- 2) If the outcomes are (TAILS, HEADS) then output Y and stop.
- 3) If the outcomes are either (HEADS, HEADS) or (HEADS, TAILS), then output N and stop.
- 4) If the outcomes are (TAILS, TAILS), then go to Step 1.

The probability that the output of the experiment is Y is (upto two decimal places).....

2 Solution

Given a fair coin is flipped twice. Let us define a Markov chain with states {1,2,3,4}, such that

State	Events
1	Event of tossing a fair coin twice
2	Event of obtaining 'N' as the output
3	Event of obtaining 'Y' as the output
4	Event of obtaining (TAIL,TAIL) as the output

TABLE 4: Representation of different events

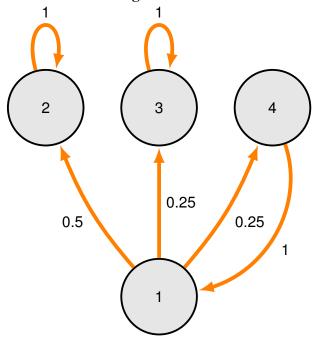

We know that when a fair coin is tossed,

$$Pr(HEAD) = 1/2 \text{ and}$$
 (2.0.1)

$$Pr(TAIL) = 1/2.$$
 (2.0.2)

Then,

Markov chain diagram:

The state transition matrix (P) for the Markov chain is

$$P = \begin{bmatrix} 1 & 2 & 3 & 4 \\ 1 & 0 & \frac{1}{2} & \frac{1}{4} & \frac{1}{4} \\ 2 & 0 & 1 & 0 & 0 \\ 3 & 0 & 0 & 1 & 0 \\ 4 & 0 & 0 & 0 \end{bmatrix}$$
 (2.0.3)

By the definition of transient and absorbing states, we can say that 1,4 are transient states whereas 2,3 are absorbing.

Then, the canonical form of the transition matrix is,

The canonical form divides the transition matrix into four sub-matrices based on the states as listed below.

$$\begin{array}{c|c} Absorbing & Non-Absorbing \\ Absorbing & I & O \\ Non-Absorbing & A & B \end{array}$$

where,

Variable	Type of Matrix
I	Identity matrix
0	Zero matrix
A, B	Some matrices

TABLE 4: Representation of different matrices

and From (2.0.4),

$$A = \begin{bmatrix} \frac{1}{2} & \frac{1}{4} \\ 0 & 0 \end{bmatrix}, B = \begin{bmatrix} 0 & \frac{1}{4} \\ 1 & 0 \end{bmatrix}$$
 (2.0.5)

The fundamental matrix F for the absorbing Markov chain is defined as

$$F = (I - B)^{-1} \tag{2.0.6}$$

Then,

$$F = \begin{bmatrix} 1 & -\frac{1}{4} \\ -1 & 1 \end{bmatrix}^{-1} \tag{2.0.7}$$

$$\implies F = \begin{bmatrix} 1.33 & 0.33 \\ 1.33 & 1.33 \end{bmatrix} \tag{2.0.8}$$

Therefore,

$$FA = \begin{bmatrix} 0.67 & 0.33 \\ 0.67 & 0.33 \end{bmatrix} \tag{2.0.9}$$

Then the limiting matrix for the markov chain is

$$\bar{P} = \begin{bmatrix} I & O \\ FA & O \end{bmatrix} \tag{2.0.10}$$

where the element p_{ij} of \bar{P} represents the probability of absorption in state j, when the initial state is i.

$$\therefore \bar{P} = \begin{bmatrix}
2 & 3 & 1 & 4 \\
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0.67 & 0.33 & 0 & 0 \\
4 & 0.67 & 0.33 & 0 & 0
\end{bmatrix}$$
(2.0.11)

Therefore,

Req. Probability =
$$p_{13} = 0.33$$
 (2.0.12)
